Summary

In some scenarios you will have scenarios that for some reason the RDP self signed certificate is not renewing as it should and hence will block the RDP connections attempts either with client side errors like *Internal Error* or that is just unable to connect and retry later.

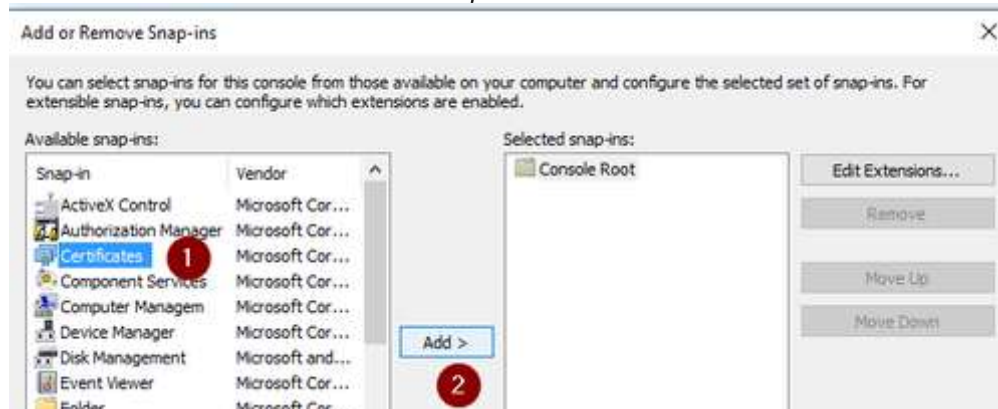

There are multiple ways to renew this certificate and one of this is by using the certificates console.

Instructions

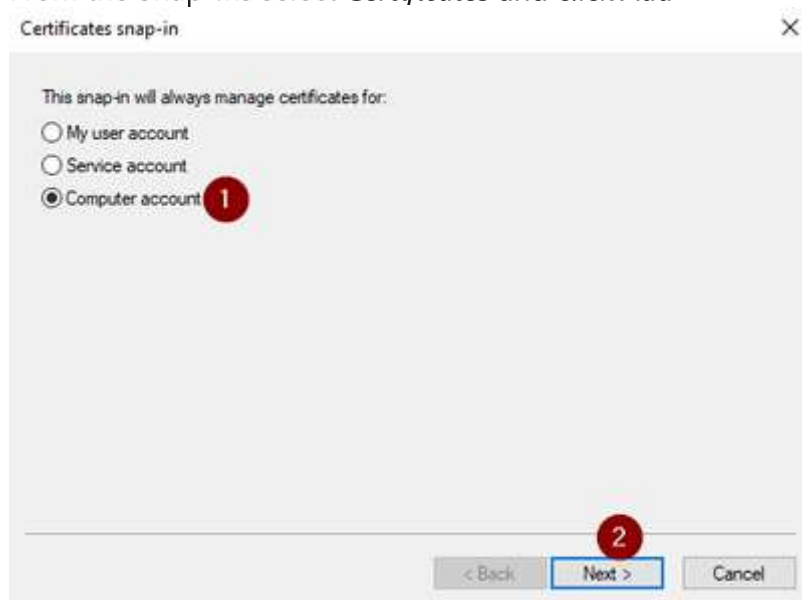

1. From a VM with connectivity to the problematic VM, open an MMC instance from *run*

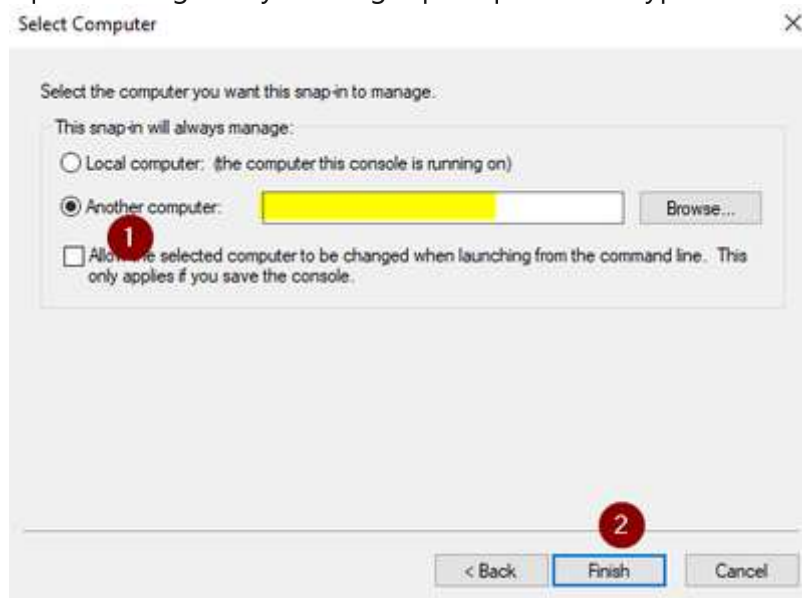

2. Go to *File* then to *Add/Remove Snap-in..*

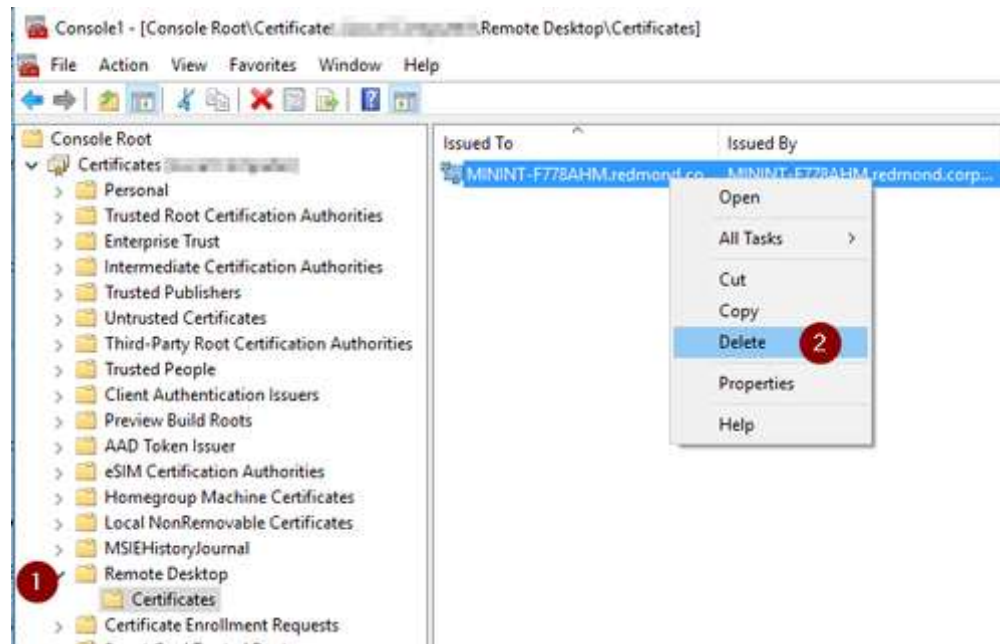

3. From the Snap-Ins select *Certificates* and click *Add*

4. Upon clicking Add you will get prompted what type of certificate you want to manage, select *Computer account* then *Next*

5. Now you will get prompted to select the machine, select *Another computer* and then add the IP of the machine that has problems. Try to make this within the internal Network and avoid using VIP. Then just click *Finish* and then *Ok*

6. Unfold the certificates and go to the *Remote Desktop*\Certificates folder then right click on the certificate and select *Delete*

7. Now just restart Remote Desktop Configuration service:

```
net stop SessionEnv  
net start SessionEnv
```

8. At this point, if you refresh the store from Remote Desktop the certificate will reappear and you could retry your RDP access
